

CDM-FLOAT is a pre-manufactured or in situ assembled floating floor solution. The system is delivered to site with full installation drawings.

System features:

- Quick and easy to install
- Installation drawings clearly show the location of the panels and the system is installed like a simple jigsaw puzzle
- Can be used to support dry and wet floating floor constructions
- Elastomer bearings or springs are fixed in the correct location to take the imposed loads
- Sound absorption material is fixed to underside of formwork

The design of the CDM-FLOAT will be carried out by CDM's engineers using the following information:

- Weight of the floating floor to be supported on the CDM-FLOAT system
- The imposed dead and live loads on the floating floor
- The required system natural frequency or sound insulation performance criteria
